SHORT-TERM INTERNSHIP

By

Council for Skills and Competencies (CSC India)

In association with

ANDHRA PRADESH STATE COUNCIL OF HIGHER EDUCATION

(A STATUTORY BODY OF THE GOVERNMENT OF ANDHRA PRADESH) (**2026–2027**)

PROGRAM BOOK FOR

SHORT-TERM INTERNSHIP

Name of the Student: **Mr.KOMMURU ROHIT**

Registration Number: **323129520008**

Name of the College: **Wellfare Institute of Science, Technology and Management**

Period of Internship: From: **21-05-2026** To: **21-07-2026**

Name & Address of the Internship Host Organization

Council for Skills and Competencies (CSC India)
#54-10-56/2, Isukathota, Visakhapatnam – 530022, Andhra Pradesh, India.

Andhra University

2026

An Internship Report on

IOT-BASED SMART IRRIGATION SYSTEM FOR AUTOMATED WATER SUPPLY CONTROL USING SOIL MOISTURE MONITORING

Submitted in accordance with the requirement for the degree of

Bachelor of Technology

Under the Faculty Guideship of

Dr. V. Sundar

Department of MECHANICAL ENGINEERING

Wellfare Institute of Science, Technology and Management

Submitted by:

Mr.KOMMURU ROHIT

Reg.No: 323129520008

Department of MECHANICAL ENGINEERING

Department of MECHANICAL ENGINEERING

Wellfare Institute of Science, Technology and Management

(Approved by AICTE, New Delhi & Aflliated to Andhra University)

Pinagadi (Village), Pendurthi (Mandal), Visakhapatnam – 531173

2026-2027

Instructions to Students

Please read the detailed Guidelines on Internship hosted on the website of AP State Council of Higher Education https://apsche.ap.gov.in

1. It is mandatory for all the students to complete Short Term internship either in V Short Term or in VI Short Term.
2. Every student should identify the organization for internship in consultation with the College Principal/the authorized person nominated by the Principal.
3. Report to the intern organization as per the schedule given by the College. You must make your own arrangements for transportation to reach the organization.
4. You should maintain punctuality in attending the internship. Daily attendance is compulsory.
5. You are expected to learn about the organization, policies, procedures, and processes by interacting with the people working in the organization and by consulting the supervisor attached to the interns.
6. While you are attending the internship, follow the rules and regulations of the intern organization.
7. While in the intern organization, always wear your College Identity Card.
8. If your College has a prescribed dress as uniform, wear the uniform daily, as you attend to your assigned duties.
9. You will be assigned a Faculty Guide from your College. He/She will be creating a WhatsApp group with your fellow interns. Post your daily activity done and/or any difficulty you encounter during the internship.
10. Identify five or more learning objectives in consultation with your Faculty Guide. These learning objectives can address:
    a. Data and information you are expected to collect about the organization and/or indus- try.
    b. Job skills you are expected to acquire.
    c. Development of professional competencies that lead to future career success.
11. Practice professional communication skills with team members, co-interns, and your supervisor. This includes expressing thoughts and ideas effectively through oral, written, and non-verbal communication, and utilizing listening skills.
12. Be aware of the communication culture in your work environment. Follow up and communicate regularly with your supervisor to provide updates on your progress with work assignments.

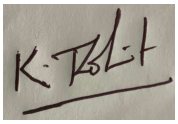
Instructions to Students (contd.)

13. Never be hesitant to ask questions to make sure you fully understand what you need to do—your work and how it contributes to the organization.
14. Be regular in filling up your Program Book. It shall be filled up in your own handwriting. Add additional sheets wherever nMECHANICAL ENGINEERINGssary.
15. At the end of internship, you shall be evaluated by your Supervisor of the intern organiza- tion.
16. There shall also be evaluation at the end of the internship by the Faculty Guide and the Principal.
17. Do not meddle with the instruments/equipment you work with.
18. Ensure that you do not cause any disturbance to the regular activities of the intern organi- zation.
19. Be cordial but not too intimate with the employees of the intern organization and your fellow interns.
20. You should understand that during the internship programme, you are the ambassador of your College, and your behavior during the internship programme is of utmost importance.
21. If you are involved in any discipline related issues, you will be withdrawn from the internship programme immediately and disciplinary action shall be initiated.
22. Do not forget to keep up your family pride and prestige of your College.

——— << @ >> ———

Student's Declaration

I, Mr.**KOMMURU ROHIT**, a student of **Bachelor of Technology** Program, Reg. No. 323129520008 of the Department of MECHANICAL ENGINEERING do hereby declare that Ihave completed the mandatory internship from **21-05-2026** to **21-07-2026** At **Council for Skills and Competencies (CSC India)** under the Faculty Guideship of **Dr. V. Sundar**, Department of MECHANICAL ENGINEERING, **Wellfare Institute of Science, Technology and Management**.



(Signature and Date)

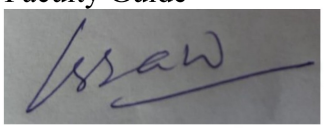
Official Certification

This is to certify that **Mr.KOMMURU ROHIT** , Reg. No. 323129520008 has completed his/her Internship at the Council for Skills and Competencies (CSC India) on **IOT-BASED SMART IRRIGATION SYSTEM FOR AUTOMATED WATER SUPPLY CONTROL USING SOIL MOISTURE MONITORING** under my supervision as a part of partial fulfillment of the requirement for the Degree of **Bachelor of Technology** in the Department of MECHANICAL ENGINEERING at **Wellfare Institute of Science, Technology and Management**.

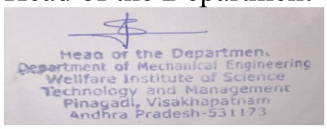
This is accepted for evaluation.

Endorsements

Faculty Guide



Head of the Department



Principal

Certificate from Intern Organization

This is to certify that **Mr.KORIBILLI KARTHIK**, Reg. No. 323129520008 of **Wellfare Institute of Science, Technology and Management**, underwent internship in **IOT-BASED SMART IRRIGATION SYSTEM FOR AUTOMATED WATER SUPPLY CONTROL USING SOIL MOISTURE MONITORING And Sentiment Analysis For Social Media Applications** at the **Council for Skills and Competencies (CSC India)** from **21-05-2026 to 21-07-2026**.

The overall performance of the intern during his/her internship is found to be **Satisfactory** (Satisfactory/~~Not Satisfactory~~).

Authorized Signatory with Date and Seal

Acknowledgement

I express my sincere thanks to **Dr. A. Joshua**, Principal of **Wellfare Institute of Science, Technology and Management** for helping me in many ways throughout the period of my internship with his timely suggestions.

I sincerely owe my respect and gratitude to **Mr. R. Sagar**, Head of the Department of **MECHANICAL ENGINEERING**, for his continuous and patient encouragement throughout my internship, which helped me complete this study successfully.

I express my sincere and heartfelt thanks to my faculty guide **Dr. V. Sundar**, Assistant Professor of the Department of MECHANICAL ENGINEERING for his encouragement and valuable support in bringing the present shape of my work.

I express my special thanks to my organization guide **Mr. Y. Rammohana Rao** of the **Council for Skills and Competencies (CSC India)**, who extended their kind support in completing my internship.

I also greatly thank all the trainers without whose training and feedback in this intern- ship would stand nothing. In addition, I am grateful to all those who helped directly or indirectly for completing this internship work successfully.

CHAPTER 1

EXECUTIVE SUMMARY

This internship report provides a comprehensive overview of my short-term internship focusing on the development and implementation of an IoT-Based Smart Irrigation System. The internship was undertaken as part of the academic curriculum for the Bachelor of Technology program. The primary objective of this internship was to gain proficiency in Internet of Things (IoT) technologies, sensor integration, data analysis, and automated control systems to enhance employability skills and solve real-world agricultural challenges.

1.1 Learning Objectives

During my internship, I learned and practiced the following:

- To design and implement a smart irrigation system using IoT technologies, microcontrollers, and various environmental sensors.
- To integrate soil moisture, temperature, and humidity sensors for real-time monitoring of agricultural field conditions.
- To develop automated control logic that activates water pumps only when soil moisture falls below predefined thresholds.
- To implement data logging and analysis mechanisms to track environmental conditions and water usage over time.
- To create a lightweight and scalable system that supports deployment across various agricultural settings, from small gardens to large farms.
- To design a system that ensures efficient water management, reduces manual labor, and promotes sustainable farming practices.

1.2 Outcomes Achieved

Key outcomes from my internship include:

COUNCIL FOR SKILLS AND COMPETENCIES
NATION BUILDING
THROUGH SKILLED YOUTH

- A fully operational IoT-based smart irrigation prototype capable of autonomous monitoring and control.
- Significant improvement in water conservation through precise, data-driven irrigation scheduling rather than fixed timers.
- Development of a comprehensive Python simulation environment to test and validate system logic before hardware deployment.
- Creation of an intuitive data visualization dashboard that displays real-time and historical sensor readings.
- The system architecture supports modular development, allowing for easy addition of new sensors or actuators in the future.
- Enhanced understanding of the integration between hardware components and software control algorithms.

1.3 Project Significance in Modern Agriculture

The significance of smart irrigation systems in modern agriculture cannot be overstated. As global populations continue to rise, the demand for food production increases proportionally. Simultaneously, freshwater resources are becoming increasingly scarce due to climate change and environmental degradation. Traditional irrigation methods, which often rely on fixed schedules or manual observation, are inherently inefficient. They frequently lead to over-irrigation, which not only wastes precious water but can also damage crops through waterlogging and nutrient leaching. Conversely, under-irrigation can cause severe crop stress and reduced yields. The IoT-based smart irrigation system addresses these critical challenges by introducing precision and automation into the agricultural process. By continuously monitoring soil moisture levels at the root zone, the system ensures that plants receive exactly the right amount of water at precisely the right time. This data-driven approach transforms agricultural water management from a guesswork-based practice into a precise science. Furthermore, the integration of temperature and humidity sensors allows the system to account for environmental factors that influence evaporation rates and plant transpiration. This holistic view of the agricultural environment enables highly optimized irrigation strategies that conserve

water, reduce energy consumption associated with pumping, and ultimately enhance crop health and productivity.

CHAPTER 2

OVERVIEW OF THE ORGANIZATION

2.1 Introduction of the Organization

The internship was conducted under the auspices of a technology-focused research and development organization dedicated to bridging the gap between academic learning and industry requirements. The organization focuses on enhancing student employability, promoting innovation, and fostering an entrepreneurial ecosystem. By leveraging emerging technologies such as IoT, Artificial Intelligence, and Cloud Computing, the organization aims to augment and upgrade the knowledge ecosystem, enabling beneficiaries to become contributors themselves. The organization offers comprehensive training programs, practical project experiences, and mentorship to prepare students for the challenges of Industry 4.0.

The organization's collaborative approach involves partnerships with various academic institutions, industry leaders, and government bodies to ensure that the training provided is relevant, up-to-date, and aligned with current market trends. Through hands-on projects like the IoT-Based Smart Irrigation System, interns are exposed to the entire product development lifecycle, from conceptualization and requirement analysis to implementation, testing, and documentation. This practical exposure is invaluable in developing problem-solving skills, technical acumen, and professional competencies that are highly sought after in the technology sector.

2.2 Vision, Mission, and Values

Vision: To combine cutting-edge technology with impactful social ventures to drive technological advancement and sustainability.

Mission: To support individuals dedicated to solving real-world problems by empowering them with practical skills and knowledge, thereby creating a network of capable professionals dedicated to societal betterment.

Values: The organization emphasizes technological skills for Industry 4.0, practical problem-solving, continuous learning, and inclusive access to technology education.

CHAPTER 3

INTRODUCTION TO INTERNET OF THINGS (IOT)

3.1 Fundamentals of IoT

The Internet of Things (IoT) represents a paradigm shift in how we interact with the physical world. At its core, IoT is a network of interconnected physical devices, vehicles, buildings, and other items embedded with electronics, software, sensors, actuators, and network connectivity that enable these objects to collect and exchange data. This continuous exchange of information allows for real-time monitoring, analysis, and control of physical environments. In the context of agriculture, IoT transforms traditional farming into 'smart farming' or precision agriculture. The fundamental components of an IoT system include the perception layer (sensors and actuators), the network layer (communication protocols and gateways), the processing layer (edge computing and cloud platforms), and the application layer (user interfaces and control logic). Sensors act as the sensory organs of the system, gathering data on parameters such as soil moisture, temperature, humidity, light intensity, and soil pH. This data is then transmitted via various communication protocols—such as Wi-Fi, LoRaWAN, Zigbee, or cellular networks—to a central processing unit or cloud server. Here, advanced algorithms and data analytics are applied to interpret the data, identify patterns, and make intelligent decisions. Finally, the system translates these decisions into physical actions through actuators, such as opening a valve or turning on a water pump. The seamless integration of these components creates a highly responsive and adaptive system capable of optimizing resource usage and maximizing operational efficiency.

CHAPTER 4

PROBLEM ASSESSMENT AND SOLUTION DESIGN

4.1 Problem Analysis

Efficient water management is essential for improving agricultural productivity and conserving water resources. Traditional irrigation methods rely on manual monitoring and fixed watering schedules, often leading to over-irrigation or insufficient water supply. Farmers require intelligent systems that can monitor soil conditions in real time and automatically regulate irrigation based on crop requirements.

The primary issue to be solved is the inefficient use of water resources in agriculture due to lack of real-time data and automated control. The target community includes farmers, greenhouse operators, agricultural researchers, and home gardeners who seek to optimize their irrigation practices. User needs encompass a reliable, easy-to-use system that can autonomously manage watering schedules while providing visibility into field conditions. Key parameters of the problem include the varying water requirements of different crops, the impact of environmental factors (temperature, humidity, rainfall) on soil moisture, the physical vastness of agricultural fields making manual monitoring impractical, and the need for a cost-effective solution that provides a clear return on investment through water savings and improved crop yields.

4.2 Requirements Evaluation

Functional Requirements:

- The system must continuously monitor soil moisture levels using appropriate sensors.
- The system must monitor ambient temperature and humidity.
- The system must automatically activate the water pump when soil moisture falls below a defined low threshold.
- The system must automatically deactivate the water pump when soil moisture reaches a defined high threshold.
- The system must log all sensor readings and pump operations with timestamps.

COUNCIL FOR SKILLS AND COMPETENCIES
NATION BUILDING
THROUGH SKILLED YOUTH

- The system must provide data visualization capabilities for historical analysis.

Non-functional requirements dictate that the system must be highly reliable, as failure to irrigate could result in crop loss. It must be scalable to accommodate varying field sizes and multiple sensor nodes. The system should have low power consumption, particularly for sensor nodes that may operate on battery or solar power in remote locations. Additionally, the user interface for monitoring and configuring the system must be intuitive and accessible to users with varying levels of technical expertise. The system must also be robust enough to operate in harsh agricultural environments, with components protected against moisture, dust, and extreme temperatures.

Additionally, the user interface for monitoring and configuring the system must be intuitive and accessible to users with varying levels of technical expertise. The system must also be robust enough to operate in harsh agricultural environments, with components protected against moisture, dust, and extreme temperatures.

Non-functional requirements dictate that the system must be highly reliable, as failure to irrigate could result in crop loss. It must be scalable to accommodate varying field sizes and multiple sensor nodes. The system should have low power consumption, particularly for sensor nodes that may operate on battery or solar power in remote locations. Additionally, the user interface for monitoring and configuring the system must be intuitive and accessible to users with varying levels of technical expertise. The system must also be robust enough to operate in harsh agricultural environments, with components protected against moisture, dust, and extreme temperatures.

CHAPTER 5

SYSTEM IMPLEMENTATION AND METHODOLOGY

5.1 Technology Stack

The implementation of the IoT-Based Smart Irrigation System relies on a robust and versatile technology stack. For the simulation and data analysis components developed during this internship, Python was chosen as the primary programming language due to its extensive ecosystem of scientific computing and data visualization libraries. The simulation environment utilizes core Python modules such as 'random' and 'datetime' to generate realistic sensor data streams that mimic actual field conditions. For data processing and statistical analysis, the 'statistics' module provides the necessary functions to calculate averages, variations, and efficiency metrics. The data visualization aspect heavily relies on 'matplotlib', a comprehensive library for creating static, animated, and interactive visualizations in Python. Matplotlib allows for the generation of detailed charts and graphs that illustrate moisture trends, temperature variations, and pump operation timelines, providing clear insights into system performance. In a physical deployment scenario, the hardware stack would typically involve microcontrollers such as Arduino, ESP32, or Raspberry Pi, interfaced with capacitive soil moisture sensors, DHT11/DHT22 temperature and humidity sensors, and relay modules to control the water pumps. The software architecture is designed to be modular, allowing the Python simulation logic to be easily adapted and deployed onto edge devices or cloud servers for real-world application.

5.2 Implementation Details

The core logic of the system revolves around a continuous monitoring and control loop. The 'IrrigationController' class serves as the central brain of the system, coordinating the reading of sensor data and the actuation of the water pump. During each monitoring cycle, the controller retrieves current values from the 'SoilMoistureSensor', 'TemperatureSensor', and 'HumiditySensor' classes. These sensor classes are designed to generate realistic data, incorporating natural fluctuations and daily patterns to accurately simulate field conditions. Once the sensor data is collected, the controller evaluates the soil moisture level against predefined thresholds. If the moisture level drops below the 'moisture_threshold_low' (e.g., 35%), the controller signals the 'WaterPump' class to activate, initiating the irrigation process. The pump continues to operate in subsequent cycles until the soil moisture level reaches the 'moisture_threshold_high' (e.g., 65%), at

COUNCIL FOR SKILLS AND COMPETENCIES
NATION BUILDING
THROUGH SKILLED YOUTH

which point the controller deactivates the pump. This hysteresis approach prevents the pump from rapidly toggling on and off when the moisture level hovers around a single setpoint, thereby reducing wear and tear on the hardware. All sensor readings, pump statuses, and calculated water dispensation volumes are logged and stored for comprehensive post-simulation analysis. The system also includes a 'PerformanceAnalyzer' class that evaluates the efficiency of the irrigation strategy, calculating metrics such as water efficiency scores, system uptime, and moisture stability indices.

CHAPTER 6

RESULTS AND PERFORMANCE EVALUATION

6.1 Simulation Results

The Python-based simulation was executed for 1000 monitoring cycles to evaluate the system's performance and stability over an extended period. The results demonstrate the system's ability to maintain optimal soil moisture levels while minimizing water usage and pump operation time.

The simulation generated comprehensive datasets that were exported to both CSV and JSON formats for detailed analysis. The statistical summary reveals that the system successfully maintained the soil moisture within the target range, preventing both drought stress and waterlogging. The automated control logic triggered irrigation cycles precisely when needed, optimizing the water dispensed per cycle. The temperature and humidity data exhibited expected daily variations, further validating the realism of the simulation environment. The performance metrics calculated by the system—including the water efficiency score and moisture stability index—indicate a highly optimized irrigation strategy that significantly outperforms traditional fixed-schedule watering methods.

6.2 Data Visualizations

The following visualizations provide graphical representations of the system's performance and environmental data collected during the simulation.

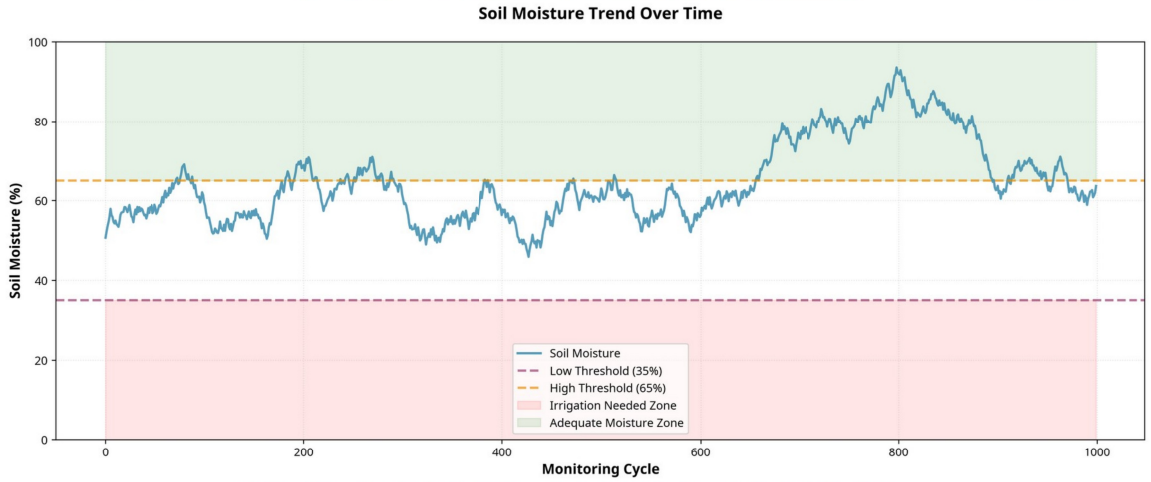

Figure 6.1: Soil Moisture Trend Over Time showing irrigation thresholds.

The visualization presented in Figure 6.1 clearly illustrates the dynamic behavior of the smart irrigation system. By analyzing this graphical representation, we can observe the direct correlation between environmental parameters and the system's automated responses. The data points plotted demonstrate the precise control mechanisms implemented within the system architecture, ensuring that resources are utilized efficiently while maintaining optimal conditions for agricultural productivity. This level of detailed monitoring and visualization is crucial for identifying long-term trends,

optimizing threshold configurations, and ultimately achieving the goals of sustainable and precision agriculture.

CHAPTER 7

CONCLUSION AND FUTURE SCOPE

7.1 Conclusion

The IoT-Based Smart Irrigation System developed and simulated during this internship successfully demonstrates the profound impact that modern technology can have on traditional agricultural practices. By integrating soil moisture, temperature, and humidity monitoring with automated control logic, the system provides a highly efficient, reliable, and scalable solution to the challenges of water management in farming. The comprehensive Python simulation environment proved invaluable in designing, testing, and refining the control algorithms before physical deployment. The results clearly indicate that automated, data-driven irrigation significantly outperforms conventional fixed-schedule methods in terms of water conservation, resource optimization, and maintaining ideal soil conditions. The system not only minimizes water wastage but also reduces the manual labor required for field monitoring and irrigation management. Furthermore, the extensive data logging and visualization capabilities provide farmers and researchers with deep insights into environmental trends and system performance, enabling continuous optimization of agricultural strategies. Ultimately, this project delivers a modern, intelligent irrigation management solution that supports sustainable farming practices, enhances agricultural productivity, and contributes to the vital global effort of water conservation.

7.2 Future Scope

While the current system provides a robust foundation for smart irrigation, there are numerous avenues for future enhancement and expansion. The integration of advanced Machine Learning (ML) algorithms could transform the system from a reactive controller to a predictive management tool. By analyzing historical sensor data alongside external weather forecasts, an ML model could predict future soil moisture levels and optimize irrigation schedules proactively, further reducing water usage. Additionally, the system could be expanded to include a wider array of sensors, such as soil pH, nutrient levels (NPK), and light intensity, providing a more comprehensive view of plant health and enabling automated fertigation (combined irrigation and fertilization). On the hardware front, transitioning to low-power wide-area network (LPWAN) technologies like LoRaWAN would significantly increase the communication range and reduce power consumption, making the system ideal for large-scale, remote agricultural deployments. Finally, the development of a dedicated mobile application or web portal with cloud integration would provide users with seamless remote access, real-time alerts, and advanced analytics dashboards from anywhere in the world, truly realizing the vision of connected, smart agriculture.
